

Horse mackerel (*Trachurus trachurus*) in Subarea 8 and divisions 2.a, 4.a, 5.b, 6.a, 7.a–c, and 7.e–k (Northeast Atlantic)

ICES advice on fishing opportunities

ICES advises that when the MSY approach is applied there should be zero catch in 2023.

Stock development over time

Fishing pressure on the stock is above F_{MSY} and between F_{pa} and F_{lim} ; spawning-stock size is below MSY $B_{trigger}$, B_{pa} , and B_{lim} .

*** The B_{pa} , B_{lim} , and MSY $B_{trigger}$ options were left blank because none of them be achieved in 2024, even with a zero catch in 2023.

[^] Closest available approximation to SSB_{2023} .

^{^^} HCR proposed by PelAC 2020 and reviewed by ICES (ICES, 2021a). The recovery time frame will differ from that indicated during the evaluation in 2020 as the perception of the stock has changed.

The catch advice for 2023 is 100% lower compared to that provided in 2022. The stock has been revised down in the latest assessment such that SSB is below B_{lim} and is forecast to remain below B_{lim} in 2024 even under a scenario of zero catch in 2023.

Basis of the advice

Advice basis	MSY approach
Management plan	ICES is not aware of any agreed precautionary management plan for horse mackerel in this area

Quality of the assessment

Recent assessments show a strong retrospective pattern with a consistent downward revision in absolute level of SSB and an upward revision in F. However, this does not affect the zero catch advice for 2023.

Figure 2 Horse mackerel in Subarea 8 and divisions 2.a, 4.a, 5.b, 6.a, 7.a–c, and 7.e–k. Historical assessment results. The reference points were revised in 2019 following an interbenchmark (ICES, 2019), and only the last four assessment results should be compared to the reference points.

Issues relevant for the advice

ICES provides zero-catch advice for this stock in 2023 because the SSB remains below B_{lim} by 2024 under all catch scenarios.

ICES stock data category	1 (ICES, 2022a)
Assessment type	Length- and age-based analytical assessment (Stock Synthesis 3; NOAA Toolbox)
Input data	Commercial catches: international catches, length and age data from catch sampling. Three survey indices: triennial egg survey index (I4189, 1992–2019); a combined recruitment index (2003–2021) derived from EVHOE (G9527), IGFS (G7212), SCOWCGFS (G4748 and G4815), and SWC-IBTS (G1179 and G4299); PELACUS acoustic biomass index ([A2548], 1992–2019, 2021). Length frequency distribution from the PELACUS survey. Time variant maturity-at-age. Natural mortality constant at 0.15 for all ages and years.
Discards and bycatch	Partial (prior to 2014) and full (since 2014) discards are included in the assessment.
Indicators	None
Other information	The stock was benchmarked in 2017 (ICES, 2017). The reference points were updated in 2019 (ICES, 2019) and 2021 (ICES, 2021b)
